

**HOW TO:**

**INSTALL CZVR  
EUROSCOPE PACKAGE**

### **Introduction**

The Vancouver FIR does not use CANscope. It is advisable to uninstall CANscope before trying to install our files.

We recommend you download the latest Euroscope beta, which can be found here:

<http://euroscope.hu/installbeta/changes.html>

Our sector files are found here:

<http://files.aero-nav.com/CZVR>

### **Installation – First Time**

CZVR Package\_Final is the “full” file. It includes everything. CZVR Package\_Update only includes the select files that have changed since the last update.

If you missed out on an AIRAC update, it is advisable to install Package\_Final again.

1. When downloading the CZVR Euroscope package first time, please download the CZVR Package\_Final file.
2. After installing your Package\_Final, unzip the file to your C: drive root folder. Once you have done this it should be located in C:\.
3. When you open Euroscope, it should prompt you to “Open Profile File”. Navigate to C:\CZVR-Package-Final, and open the CZVR.prf file in there.
4. After you have done this, you will have to enter your details in the connect dialogue and remember to hit “save” once you’ve finished your session.

### **Installation – Update**

This is the guide for what to do each time you update your ES package:

1. Download CZVR Package\_Update file.
2. Once installed, unzip the file to your Package\_Final file, in the C:\ folder, overwriting the files there.
3. Delete your old .sct, .ese, and .rwy files.
4. After you open Euroscope, you will have to navigate to Open SCT>Load Sector File, navigating to your new sector file.
